

Thomas Höllt / Prof. Dr. Elmar Eisemann
Computer Graphics and Visualization
TU Delft

Graphics API

- Two major types: DirectX & OpenGL
 - Allows us to send commands to the card
 - Relatively close to hardware
- Recent push to decrease overhead
 - DX 12
 - Vulkan
 - Metal

Graphics API

- We will use OpenGL
- OpenGL is a state machine
 - ↳ activate something and it stays activated

<http://tinyurl.com/OpenGLTutorial>

OpenGL Initialization

- Set up whatever state you're going to use

```
void init( void )
{
    glClearColor( 0.0, 0.0, 0.0, 1.0 );
    glClearDepth( 1.0 );

    glEnable( GL_LIGHT0 );
    glEnable( GL_LIGHTING );
    glEnable( GL_DEPTH_TEST );
}
```

OpenGL Geometric Primitives

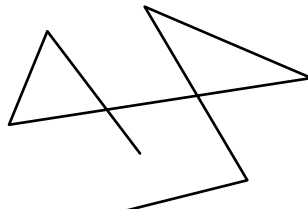

- All geometric primitives are specified by vertices

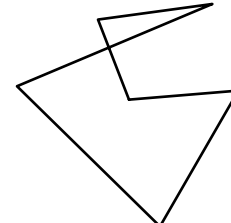

GL_POINTS

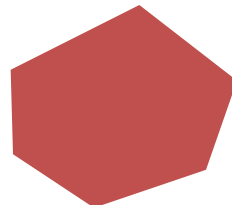

GL_LINES

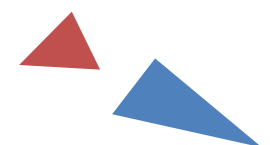

GL_LINE_STRIP

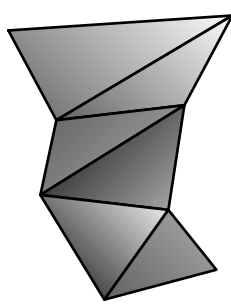

GL_LINE_LOOP

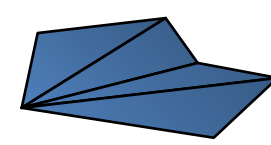

GL_POLYGON

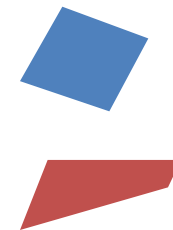

GL_TRIANGLES

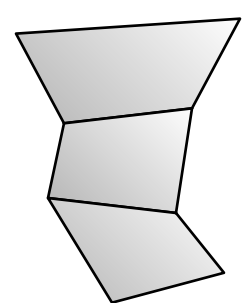

GL_TRIANGLE_STRIP

GL_TRIANGLE_FAN

GL_QUADS

GL_QUAD_STRIP

Simple Example

```
void drawRhombus( GLfloat color[] )
{
    glBegin( GL_QUADS );
    glColor3fv( color );
    glVertex2f( 0.0, 0.0 );
    glVertex2f( 1.0, 0.0 );
    glVertex2f( 1.5, 1.118 );
    glVertex2f( 0.5, 1.118 );
    glEnd();
}
```

OpenGL Command Formats

`glVertex3fv(v)`

*Number of
components*

2 - (x,y)
3 - (x,y,z)
4 - (x,y,z,w)

Data Type

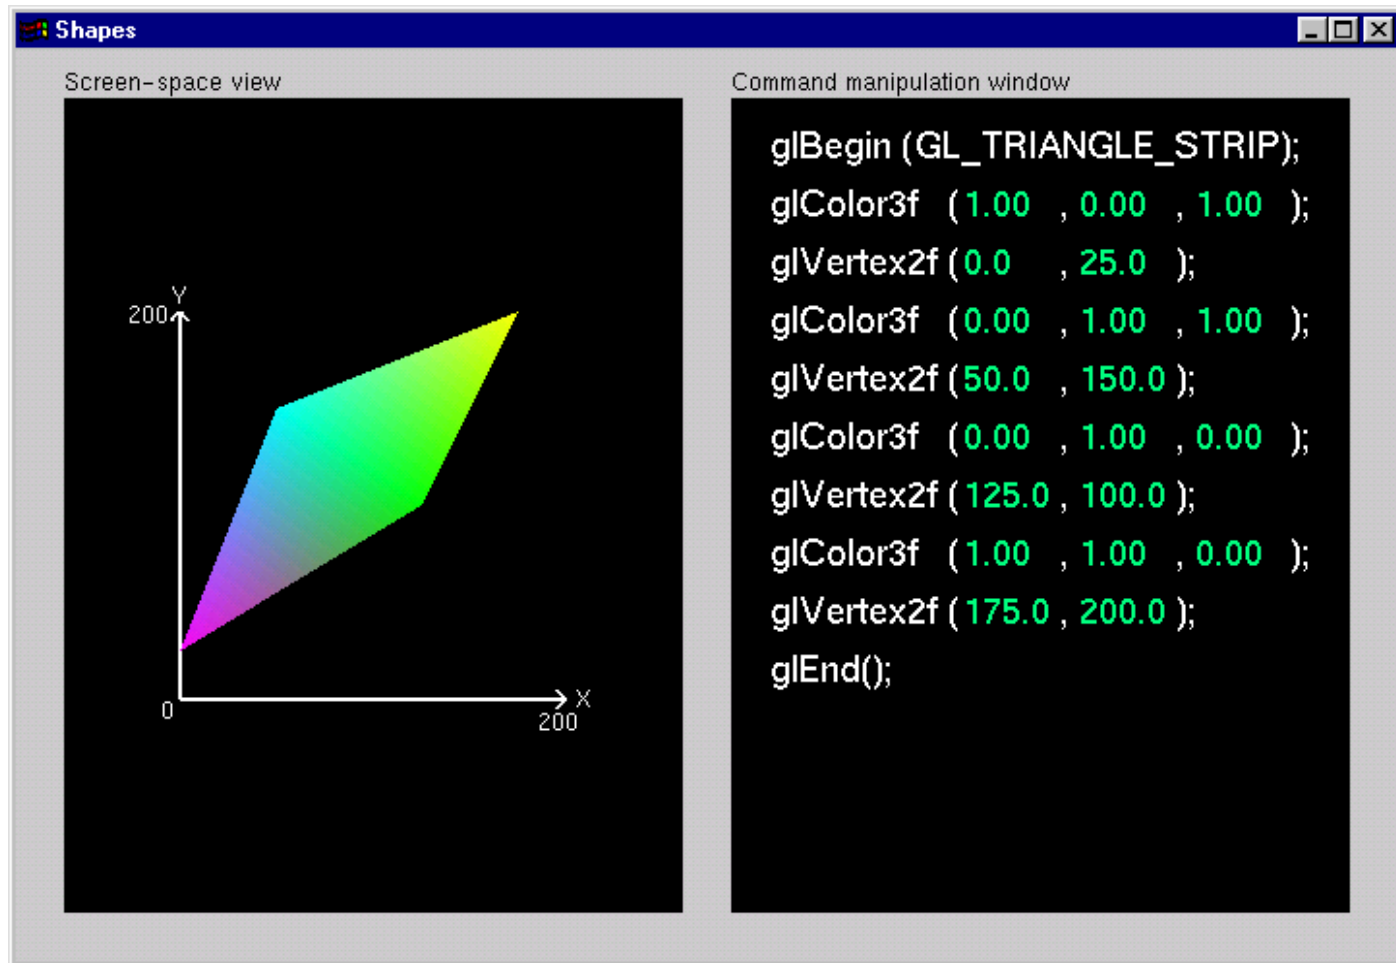

b - byte
ub - unsigned byte
s - short
us - unsigned short
i - int
ui - unsigned int
f - float
d - double

Vector

omit "v" for
scalar form

`glVertex2f(x, y)`

Shapes Tutorial

Cameras and Projection

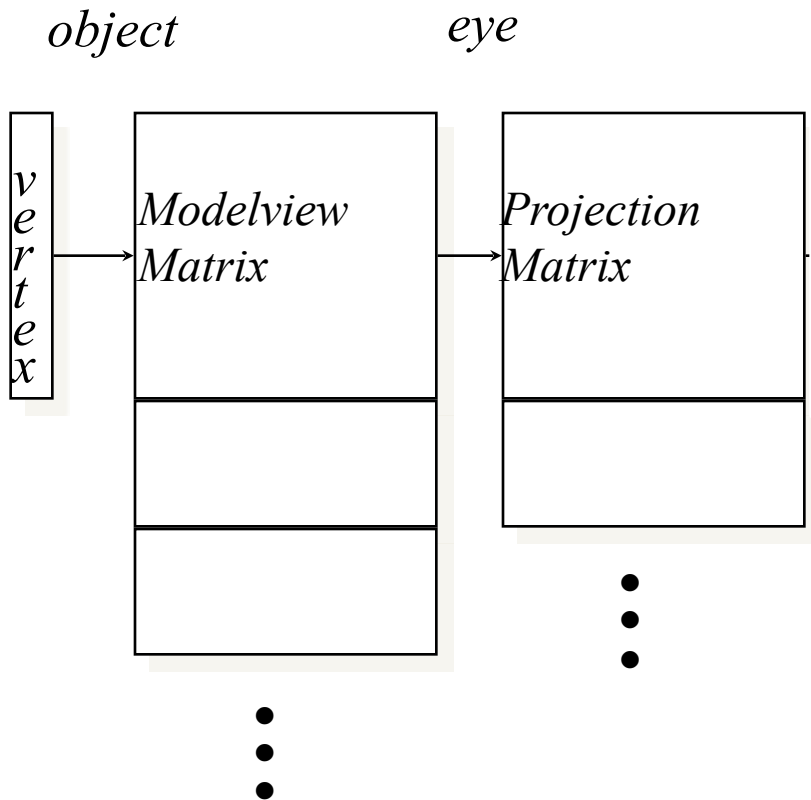

Transformations in OpenGL

- Modeling
- Viewing
 - orient camera
 - projection
- Animation
- Map to screen

3D Transformations

- A vertex is transformed by 4 x 4 matrices
 - all affine operations are matrix multiplications
 - all matrices are stored column-major in OpenGL
 - matrices are always post-multiplied
 - product of matrix and vector is a vector

Transformation Pipeline

Matrix Operations

- Viewport (pixel mapping – in all exercises, no need to touch)

`glViewport(x, y, width, height)`

= where to draw on the screen

- Transformations
- Specify Current Matrix Stack

`glMatrixMode(GL_MODELVIEW)`

Or `glMatrixMode(GL_PROJECTION)`

- Other Matrix or Stack Operations

`glLoadIdentity()` `glLoadMatrix` `glMultMatrix`

`glPushMatrix()` `glPopMatrix()`

– Use friendly calls of `glMultMatrix`:

`glRotate` `glTranslate` `glScale`

Specifying Transformations

- Two styles of specifying transformations
 - specify matrices (`glLoadMatrix`, `glMultMatrix`)
 - specify operation (`glRotate`, `glOrtho`)
- Programmers do not have to remember exact matrices
 - check appendix of Red Book (Programming Guide)

Programming Transformations

- Prior to rendering, view, locate, and orient:
 - eye/camera position
 - 3D geometry
- Manage the matrices
 - including matrix stack
- Combine (composite) transformations

Projection Transformation

- Shape of viewing frustum
- Perspective projection

`gluPerspective(fovy, aspect, zNear, zFar)`

- Orthographic parallel projection

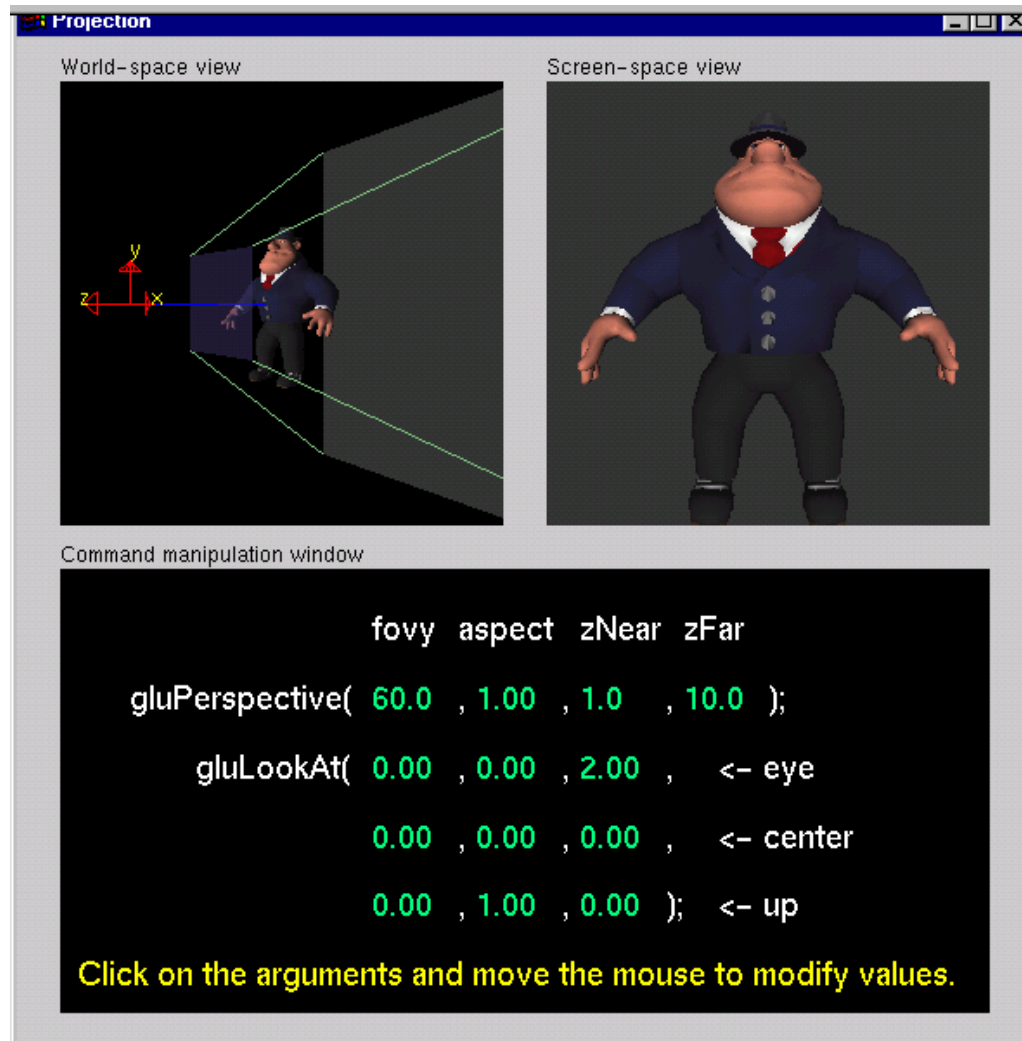

`glOrtho(left, right, bottom, top, zNear, zFar)`

Viewing Transformations

- Position the camera/eye in the scene
 - place the tripod down; aim camera
- To “fly through” a scene
 - change viewing transformation and redraw scene
- `gluLookAt(eyex, eyey, eyez,
aimx, aimy, aimz,
upx, upy, upz)`
 - up vector determines unique orientation
 - careful of degenerate positions

Projection Tutorial

<http://tinyurl.com/OpenGLTutorial>

Modeling Transformations

- Move object

glTranslate{fd} (*x*, *y*, *z*)

- Rotate object around arbitrary axis

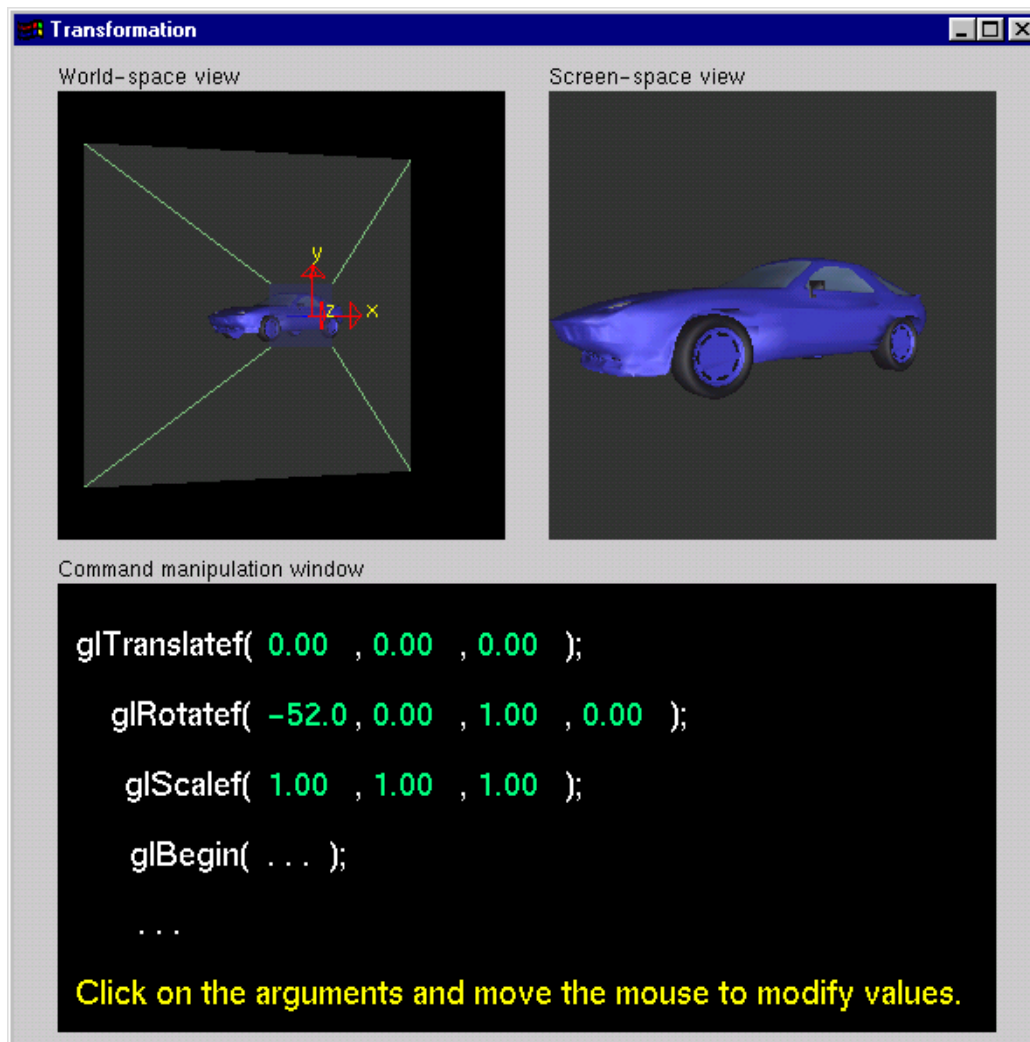

glRotate{fd} (*angle*, *x*, *y*, *z*)

– angle is in degrees

- Dilate (stretch or shrink) or mirror object

glScale{fd} (*x*, *y*, *z*)

Transformation Tutorial

<http://tinyurl.com/OpenGLTutorial>

Object Hierarchies

MyFunctionToDrawObjects

- Concatenate operations
- Use relative coordinates:
 - Position of hand with respect to arm
 - Position of arm with respect to body
 - ...

Why concatenate operations?

- Often, objects are defined as combinations
 - Examples : robots, cars (wheels)...
- We want a natural behavior:
 - Object stays connected:
 - If you move the arm, the hand should follow

Matrix Stack

- Keep information about modifications
 - `glPushMatrix(); T (glTranslatef(x,y,z);` to position)
 - draw car body
 - `glPushMatrix(); TT2 (glTranslatef(u,v,w);` to 1st wheel)
 - draw first wheel as circle of center (0,0)
 - return to **T**: `glPopMatrix();`
 - `glPushMatrix(); TT3 (glTranslatef(r,s,t);` to 2nd wheel)
 - draw second wheel
 - `glPopMatrix(); glPopMatrix();`

Manipulating OpenGL State

- Appearance is controlled by current state
for each (primitive to render) {
 update OpenGL state
 render primitive
}
- Manipulating vertex attributes is most
common way to manipulate state
 glColor* ()
 glNormal* ()
 glTexCoord* ()

Controlling current state

- Setting State, e.g.,
`glPointSize(size);`
`glShadeModel(GL_SMOOTH);`
- Enabling Features, e.g.,
`glEnable(GL_LIGHTING);`

Lighting

Lighting Principles

- Lighting simulates how objects reflect light
 - material composition of object
 - light's color and position
 - global lighting parameters
 - ambient light
 - two sided lighting

How OpenGL Simulates Lights

- Phong lighting model
 - Computed at vertices
- Lighting contributors
 - Ambient (global)
 - Diffuse (material, light)
 - Specular (material, light)
 - Emission (material)

Surface Normals

- Normals define how a surface reflects light

```
glNormal3f( x, y, z )
```

- Current normal is used to compute vertex's color
- Use *unit* normals for proper lighting
 - scaling affects a normal's length

```
glEnable( GL_NORMALIZE )
```

or

```
glEnable( GL_RESCALE_NORMAL )
```

Material Properties

- Define the surface properties of a primitive
`glMaterialfv(face, property, value);`
 - separate materials for front and back

GL_DIFFUSE	Base color
GL_SPECULAR	Highlight Color
GL_AMBIENT	Low-light Color
GL_EMISSION	Glow Color
GL_SHININESS	Surface Smoothness

Ambient Term

- Very simplistic
 - No real physical basis...
 - No indications on the shape of an objet!

K_a croissant

- But often used in practice
 - Emulates indirect light from scene
 - Elements in shadow are not completely black

Diffuse Term

- Hypothesis: isotropic *a.k.a* lambertian
- Shading varies along surface
 - Gives information about shape

- Does not depend on observer position!

Specular Term

Light Properties

```
glLightfv( light, property, value );
```

– *light* specifies which light

- multiple lights, starting with `GL_LIGHT0`

```
glGetIntegerv( GL_MAX_LIGHTS, &n );
```

– *properties*

- **colors** (`GL_AMBIENT`, `GL_DIFFUSE`, `GL_SPECULAR`)
- **position** (`GL_POSITION`)
- **attenuation** (`GL_CONSTANT_ATTENUATION`,
`GL_LINEAR_ATTENUATION`, `GL_QUADRATIC_ATTENUATION`)

Types of Lights

- OpenGL supports two types of Lights
 - Local (Point) light sources
 - Infinite (Directional) light sources
- Type of light controlled by w coordinate
 - Remember points at infinity! $w=0 \rightarrow$ directional

Turning on the Lights

- Flip each light's switch

```
glEnable( GL_LIGHTn );
```

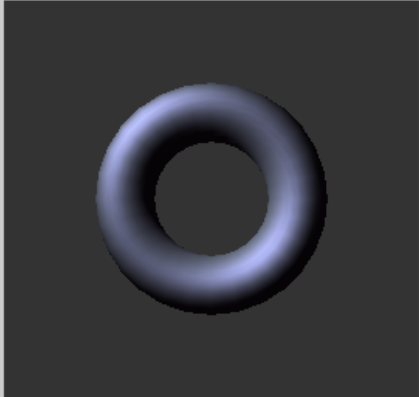

- Turn on the power

```
glEnable( GL_LIGHTING );
```

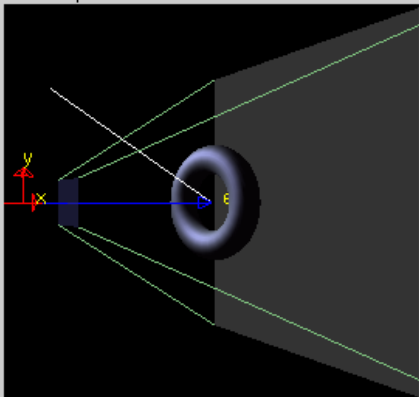

Light Material Tutorial

Light & Material

Screen-space view

World-space view

Command manipulation window

```
GLfloat light_pos[ ] = { -2.00 , 2.00 , 2.00 , 1.00 };
GLfloat light_Ka[ ] = { 0.00 , 0.00 , 0.00 , 1.00 };
GLfloat light_Kd[ ] = { 1.00 , 1.00 , 1.00 , 1.00 };
GLfloat light_Ks[ ] = { 1.00 , 1.00 , 1.00 , 1.00 };

glLightfv(GL_LIGHT0, GL_POSITION, light_pos);
glLightfv(GL_LIGHT0, GL_AMBIENT, light_Ka);
glLightfv(GL_LIGHT0, GL_DIFFUSE, light_Kd);
glLightfv(GL_LIGHT0, GL_SPECULAR, light_Ks);

GLfloat material_Ka[ ] = { 0.11 , 0.06 , 0.11 , 1.00 };
GLfloat material_Kd[ ] = { 0.43 , 0.47 , 0.54 , 1.00 };
GLfloat material_Ks[ ] = { 0.33 , 0.33 , 0.52 , 1.00 };
GLfloat material_Ke[ ] = { 0.00 , 0.00 , 0.00 , 0.00 };
GLfloat material_Se = 10 ;

glMaterialfv(GL_FRONT, GL_AMBIENT, material_Ka);
glMaterialfv(GL_FRONT, GL_DIFFUSE, material_Kd);
glMaterialfv(GL_FRONT, GL_SPECULAR, material_Ks);
glMaterialfv(GL_FRONT, GL_EMISSION, material_Ke);
glMaterialfv(GL_FRONT, GL_SHININESS, material_Se);
```

Click on the arguments and move the mouse to modify values.

<http://tinyurl.com/OpenGLTutorial>

What we use: in practice!

- OpenGL mode: `glEnable(GL_COLOR_MATERIAL);`
makes color become a material

Hence: glColor defines a diffuse material

Then you only need to define, LightPos:

```
glLightfv( GL_LIGHT0, GL_POSITION, pos );
```

That is all for today...

Books

- OpenGL Programming Guide
- OpenGL Reference Manual
- OpenGL Programming for the X Window System
 - includes many GLUT examples
- Interactive Computer Graphics:
A top-down approach with OpenGL

Thank you very much
for your attention!
